Quantities are limited and will be filled on a first-come first-serve basis. Please note that items are sold "Bare Root."

TREE DESCRIPTIONS

APPLE TREES

Crimson® Gold is a disease resistant cultivar harvesting the second week in September, just ahead of Golden Delicious. The fruit colors nicely with a near full red-orange blush on a yellow background. The flesh is white, firm and juicy. Apples are medium in size with a sweet-tart flavor. Fruit has storage life of up to eight months. The trees have medium vigor and are very productive, so they should be thinned accordingly. Crimson® Gold is very resistant to apple scab.

Granny Smith is a late, green, tart apple, maturing in early November. Develops a red blush in the Northeast. High-quality eating apple with a storage life equal to Fuji.

Yellow Transparent is an apple ripening the first week in July. The fruit is tender, juicy and mildly acid, making it a favorite for homemade applesauce. Trees are upright, vigorous, and very precocious, however tend to be biennial. Yellow Transparent is an early blooming variety and can pollinate all other early blooming apple varieties as well as varieties with mid-season bloom times.

Cortland is a McIntosh x Ben Davis cross that inherited the good qualities of both parents. Fruit is a beautiful red, very large, with pure white flesh. Crops heavier than most varieties and considered an annual bearer. Picked seven to ten days after McIntosh.

Golden Delicious a russet-resistant selection of the original Golden Delicious. One of the most widely planted apple cultivars worldwide. Fruit is firm, medium to large with the classic Golden Delicious flavor. The tree is spreading, productive and easy to manage. Fruit thinning is required to maintain annual bearing.

CHERRY TREES

Montmorency is a tart cherry variety has long been recognized as the standard of the industry. Montmorency is planted throughout North America and is considered the best tart cherry for the processing market. The fruit is bright red and medium in size with a clear, juicy flesh. The trees are self-fertile, winter hardy and very productive.

PEACH TREES

Contender is a high quality, freestone variety ripening mid-August. Fruit is very firm, large, with excellent color. The trees are hardy and very productive.

PLUM TREES

Methley is an early plum with fine quality and appearance. The fruit is purple with red, sweet flesh, and very juicy with a distinctive flavor. Ripening in early to mid-July, Methley is self-fertile.

Stanley is a New York State Agricultural Experiment Station introduction and leading cultivar in the Great Lakes region. A fine prune-type plum with excellent quality suited for both home use and processing. Fruit is large in size with dark blue skin. Flesh is greenish-yellow, juicy and fine-grained. The tree is early bearing and a good pollinizer for other European varieties.

PEAR TREES

Potomac is a Moonglow x Beurre D'Anjou cross developed by the USDA and The Ohio State University. The fruit is moderate size, averaging 2-1/2". The flesh texture is moderately fine and buttery. The flavor is pleasingly sub-acid with mild aroma and is similar to Beurre D'Anjou in character. The tree is moderately vigorous and resistant to fire blight. Matures early September.

Harrow Sweet is late-season pear developed by the Harrow Research Station in Ontario, Canada, AC™ Harrow Sweet ripens approximately three weeks after Bartlett. This variety has shown very good resistance to fire blight. The fruit size and appearance are similar to that of Bartlett; however, AC™ Harrow Sweet does develop an attractive blush. Trees should be thinned to maintain fruit size and avoid biennial bearing.

Any delay in picking up your plants will reduce the chances of survival!

PLANT DESCRIPTIONS

Raspberries

Heritage: Ever-bearing top-quality fruits and heavy yielding, starts cropping early in summer on old canes, then continues bearing even more heavily on new canes through fall. The red berries are large and flavorful. Plants are ¼" & up at collar.

Jewel: Black Raspberries, hardy and reliable. Glossy fruits ripen in midseason, show desirable firmness and excellent flavor. Good yields in shade and just about any soil type. Plants are 3/16" & up at collar.

Blackberries

Arapaho: A self-supporting thornless blackberry; grows in huge clusters that ripen over a long season. Plant are 3/16" and up at collar.

Blueberries

In spring (middle of May) the blueberry bush has many white bell-like blossoms and will have ripe berries from the middle of July through August. Through the summer months the plant has dark green wax-like foliage. In fall leaves will turn a beautiful crimson color, and during winter months the light green or reddish colored wood provides winter color. Recommend planting two varieties for increased yield and larger berries. Plants are 12 – 18".

Strawberries

Jewel: June bearing, midseason, a large, firm berry with very good flavor.

NOTE: The replacement guarantee is limited to 60 days.

PLANTS ARE SOLD "BARE ROOT". Any delay in picking up plants will reduce the chances of survival
